

HNDIT4242-Computer Services Management

Week 01

Introduction to Computer Services Management

Computer Services Management

- Computer Services Management formerly known as “ITSM” (IT Services Management) is the subject focusing on delivering IT services aligning to the customer-needs, continuously under a “Service Level Agreement [\(SLA\)](#)”.

Customers

- CSM or ITSM is mainly focusing on the customers' or clients' needs and wants.
- Customers are basically can be introduced in 2 categories as “Internal customers” and “External customers”.
 - Internal customers

For the IT department of a company, all the employees of the other departments
 - External customers

the persons who pay money to have services provided by the above mentioned company (for outside business organizations)

Departments under Computer Services Department

- There are 5 departments ruled under the IT Services Department of any company. They are:
 - Help Desk/ Service Desk Department
 - Development Department
 - Technical Department
 - Operations Department
 - Network Department

Help Desk Department

- Acting as a **single point of contact** instead of the **first point of contact**
- Directly dealing with customers by providing basic instructions upto a certain extent/ level when they request help
- Recording issues arisen with the products or services provided
- Transferring customer requests to the relevant department.
- Warning to the top-level management based on the recorded facts (for making decisions in future)
- **Software used:-**
 - The Help Desk employees normally have the ability to work with some sort of software systems such as “[HelpSpot](#), [JIRA](#), [Client Engage](#)” and so on. They are
 - considered as “Project Management Software as well (Based on their functions)”. ACD (Automatic Call Distributor) systems are also found herein.

Development Department

- The employees in the department develop the software systems to be sold. There are programmers, software engineers, architects, QA engineers and testers, analysts, designers and so on.
- They work with the “Application Code”. They are involved in developing and testing the systems as well as documenting all the necessary portions/ sub-systems of the system. They use different IDE’s and frameworks with different languages as appropriate to develop the systems.

Technical Department

- work with “Non-application Code” which means setting up the database connectivity and providing the environment to run the systems smoothly.
- There are database engineers, technical assistants as well. They have to deal with DBMS's and Operating Systems.

Operations Department

- Software installation and some kind of amendments of the application code also are done as required by the employees of the department. The employees work under the “Operations manager”.

Network Department

- Network department is responsible to provide all the necessary infrastructures to install the systems and ensuring the 3rd party services gained from the
- outside environment including the Internet Connection, telephone system and VPN's etc.
